DESIGNED TO BE FUTURE-PROOF

Micropol's high quality pigtail is designed to deliver optical prestanda for future bandwidth requirements. The product is well protected and the connectors are sorted in numerical order to facilitate installation.

We manufacture pigtails according to your wishes regardless of length, type of fiber or choice of connectors. And they are delivered in a environmentally friendly and smart package that makes installation easier and faster.

We have the capacity to manufacture large and small volumes, from a few items up to several thousand. Micropol pigtails are all manufactured in Sweden. This ensures short lead times and a high quality.

TELECOM (TC) OR BLUE LINE (BL)

We use the same fiber and components in manufacturing Telecom (TC) and Blue Line (BL) products. And we use the same manufacturing methods and connecting, polishing and attenuating/reflection measurement.

Blue Line products have a performance label on the packaging that gives the limit values insertion loss < 0.2 dB and return loss > 55 dB for UPC as well as verification method.

Telecom products have an ID label on the cabling as well as accompanying measurement protocol with performance for all connectors on the cabling, the measurement values are stored in Micropol's database.

All Multi Mode items are supplied as Blue Line with performance label on the packaging unless measurement protocol is asked for.
